

Traders Overcome Global Market Data Complexity with TNS

Widening trade portfolios mean many traders today need to access market data from multiple exchanges. This infographic explores how TNS is providing traders with a cost effective and feature rich alternative to handling their increasingly unique and complex connectivity requirements in-house.

Leverage TNS' Extensive Exchange Relationships

The primary requirement for a successful market data strategy is the ability to work across multiple exchanges, countries, cultures and languages.

The Challenge Facing Traders

Each exchange has a unique set of principles and protocols, which can be further complicated by language, cultural and time-zone factors.

Some exchanges require you to have a local representative, recognized by the exchange, that can work on your behalf.

Establishing new connectivity can be expensive.

Time to market is lengthy and can take months making it difficult to test markets.

TNS Offers the Solution

TNS currently works with more than 60 exchanges, ECNs and alternative trading systems globally.

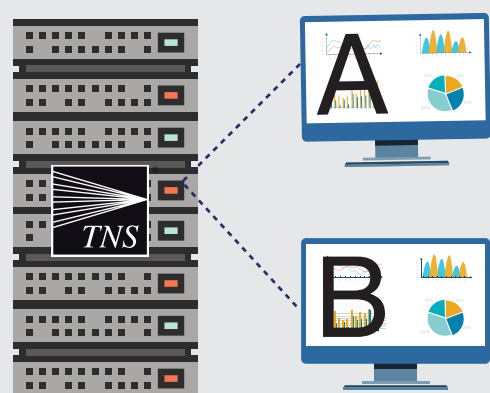

TNS has in-country teams that understand the local exchange requirements and will facilitate local hardware and telco procurement.

TNS has extensive connectivity already in place so is able to pass on the benefits of economies of scale to its customers.

TNS can help traders address fleeting new market opportunities by establishing connectivity in just days or a few weeks and withdrawing this when required.

Network Design and Engineering Factors

Network engineering expertise is essential to ensure adequate capacity and minimize risks, such as packet loss.

TNS' network includes diverse paths for both A and B market data feeds to ensure continuity.

The innovative TNSXpress Layer 1 solution offers ultra-low latency connectivity of 5-85 nanoseconds.

Outsourcing as a Key Strategic Component

Accessing and managing multiple market data feeds on a global basis can offer competitive advantage, boost reputation and bolster the bottom line, but even the largest players find it complex, time consuming and costly.

TNS offers a more cost effective way for traders to access market data. TNS takes multicast streams and then shares it with multiple clients.

TNS' network is built and designed specifically for the demanding requirements of traders. Instead of worrying about their network or multiple connections, traders can focus on their core business objectives.

Effective monitoring and support is included as standard in all TNS contracts.

Leverage TNS to set up a flexible market data infrastructure quicker and at a lower cost.
